

## Angular CLI – comandos básicos

### Crear proyectos

**ng new** <name-project> [options]   **ng n** <name-project> [options]

**ng new** curso-angular17 --style=scss

### Ejecutar nuestro proyecto localmente:

**ng serve** <name-project> [options]   **ng s** <name-project> [options]

Para ejecutar el Proyecto debes estar dentro de la carpeta:

**ng s**

### Generar Elementos de Angular

**ng generate** <schematic> / **ng g** <schematic>

**ng generate component** <name> [options]   **ng g component** <name> [options]

**ng generate service** name [options]   **ng g s** name [options]

**ng generate interceptor** name [options]   **ng g i** name [options]

**ng generate directive** <name> [options]   **ng g d** <name> [options]

### Ejemplos:

**ng generate component** login-page --standalone / **ng g component** login-page --standalone

**ng generate service** login --skip-tests / **ng g component** login-page --skip-tests

### Compilar / Transpilar nuestro Proyecto

**ng build** <project> [options]   **ng b** <project> [options]

**ng build**   **ng b**

### Compilar / Transpilar usando un environment

**ng build --configuration** <name-environment> / **ng b --configuration** <name-environment>

**ng build --configuration** develop / **ng b --configuration** develop
